It provides in vitro and in vivo reagents for studying ovarian development and function. This sequence has gynaecological and contraceptive activity. Agents which modulate Ol-180, Ol-184 and Ol-236 may be used to treat cell proliferative or degenerative disorders, associated with abnormal expression of these ovary specific genes. This ovary-specific sequence can be used as reagents to evaluate potential contraceptives, to block ovulation in a reversible manner. It is also used to screen for genetic mutations in signalling pathways, that are associated with some forms of human infertility or gynaecological cancers.

     The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides

The invention relates to methods and compositions for diagnosing tuberculosis. It provides polypeptides (see AAM64291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of a M. tuberculosis antigen, or an immunogenic portion of a M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using the composition of the patient with the patient with the composition of the patient with the composition of the patient with the p

Also described are vaccines and fusion protein containing M. tuberculosis Ag's.

M. tuberculosis Ag's, DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical composition or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretin by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAZ19249 to AAZ19460 and AAY39083 to anvagors are used in the account of the containing the part of the containing the contai

                                                                                                                                                                                                                                                                                                                  This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mycobacterium

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in agent to be tested for anti-neoplastic activity, determining a change in agent to the tested for anti-neoplastic activity, determining a change in agent of a signature gene set, where (I) accomprises a sequence (S) selected from 8447 sequences (given in ABL51664 to ABL70110), or is at least 95% identical to (S), where a change in accomprises in indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical accompanies of the agent. MI can be used in the adeas collent because in the convey the chemical consequence overlan, kidney, prostate, stomach, lung, thyroid, adeance of the agent and can be used in the consequence accompanies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches 139;

The polynucleotide sequences of the invention or a composition comprising these polynucleotides are useful as a high throughput method for detecting altered expression of one or more polynucleotides in a sample. The polynucleotides can be used in the diagnosis of disorders associated with foam cell development such as atherosclerosis, cerebral stroke, and cardiovascular disorders such as coronary artery disease. The polynucleotides sequences can also be used as PCR primers and probes. The polynucleotides of the invention are also polynucleotides of the invention are also polynucleotides equences of the invention which are differentially

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC the human alpha 1B subunit was obtd. Nucleic acid amplification cC of specific regions of the IMR32 cell alpha 1B mRNA yielded additional segments of the alpha 1B coding sequence. A full-clent alpha 1B DNA clone was constructed by ligating portions cC length alpha 1B DNA clone was constructed by ligating portions cC of IMR32 cell RNA and genomic DNA using oligo primers corresp. to compare the partial cDNA clones. Nucleic acid amplification analysis cC of IMR32 cell RNA and genomic DNA using oligo primers corresp. to compare the subunit revealed an alternatively spliced alpha cC sequences located 5' and 3' of the stop codon of the DNA encoding cC IB-encoding mRNA in IMR32 cells. This second mRNA product is the cresult of differential splicing of the alpha 1B subunit transcript to include another exon that is not present in the mRNA corresp. The alpha 1B subunit encoded by a DNA sequence that was initially isolated. The alpha 1B subunit encoded by a DNA sequence contg. an additional consist referred to as alpha 1B-1 and given in AAQ84657/R71005. Following the sequence of the additional exon in calpha 1B-1 had alpha 1B-1 and alpha 1B-2 encodes exon in alpha 1B-1 had alpha 1B-1 and alpha 1B-2 encodes exon in alpha 1B-1 and alpha 1B-2 encodes exon in calpha 1B-1 had alpha 1B-2 encodes exon in alpha 1B-1 and alpha 1B-2 encodes exon in alpha 1B-1 and alpha 1B-2 encodes exon in alpha 1B-2 exon in alpha 1B-2 encodes exon in alpha 1B-2 encod
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding the alpha 1B subunit was isolated by screening a human basal ganglia cDNA library with fragments of the rabbit skeletal muscle calcium channel alpha 1 subunit-encoding cDNA. A portion of one of the positive clones was used to screen an IMR32 cell cDNA library. Clones that hybridised to the basal ganglia probe were used to further screen an IMR32 cell cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CDS

The present sequence is derived from alternative splicing of AAV42685. Calcium channels are membrane-spanning, multi-subunit protons.
                                                                                                                                                                                                                                                                                                                                                                                                                3'UTR

Nucleic acid probes comprising 14-30 contiguous nucleotides of beta_3 subunit encoding DNA are useful for isolation and cloning of calcium channel subunit-encoding DNA. Recombinant eukaryotic cells that express heterologous calcium channel are useful for identifying compounds that modulate calcium channel activity and in assays for identifying agonists and antagonists of calcium channel activity in humans. Human calcium channel subunit or eukaryotic cells expressing the channel are useful for diagnosing Lambert Eaton Syndrome (LES) in a human. This sequence encodes the human calcium channel alphalb-2 subunit which is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CDS
                                                                                                                                              calcium channels are disclosed. Subunit proteins (see AMAY388-60), fusion proteins, antibodies, as well as assays to identify agents that modulate calcium channel activity are also provided. Such agents can be used to treat certain central nervous system disorders by altering calcium channel activity. Methods of diagnosing diseases associated with particular calcium channels, such as Lambert-Eaton syndrome, are disclosed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WO9811131-A2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     30-JUN-1993
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAQ37817;
           DNA encoding the alpha 1B subunit was isolated by screening a human basal ganglia cDNA library with fragments of the rabbit skeletal muscle calcium channel alpha 1 subunit-encoding cDNA. A portion of one of the positive clones was used to screen an IMR32 cell cDNA library. Clones that hybridized to the basal ganglia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   310 CGCACGCTGCAGCCTGCAGGGTGCCGAGCCCGACGCCCGATCGGGTTCCTGTCAA 369

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to identify overlapping clones that in turn were used to screen a human hippocampus cDNA library. In this way, a sufficient series of clones to span nearly the entire length of the nucleotide sequence encoding the human alpha 1B subunit was obtained. PCR amplification of specific regions of the IMR32 cell alpha 1B mRNA yielded additional segments of the alpha 1B coding sequence. A full-length alpha 1B DNA clone was constructed by ligating portions of the partial cDNA clone was constructed by 11gating portions of the partial cDNA clones (see AAQ37817, AAQ37818). Alpha 1B-1 and alpha 1B-2 are derived by alternative splicing of the alpha 1B subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2988 GCCCCAAGGCCGAGCGCGCGCGCGCACCGCGGCGCCCCCGAGCGGGCCCCCGGGAG 3047

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding the alpha 1B subunit was isolated by screening a CC human basal ganglia cDNA library with fragments of the rabbit Skeletal muscle calcium channel alpha 1 subunit-encoding cDNA. CC A portion of one of the positive clones was used to screen an CC IMR32 cell cDNA library. Clones that hybridised to the basal CC IMR32 cell cDNA library. Clones that hybridised to the basal CC IMR32 cell cDNA library to identify overlapping clones that in turn were used to screen a human hippocampus cDNA libary. A series of clones to span nearly the entire length of the nt. sequence encoding CC of the human alpha 1B subunit was obtd. Nucleic acid amplification CC of specific regions of the IMR32 cell alpha 1B mRNA yleided additional segments of the alpha 1B coding sequence. A full-cc of the partial cDNA clone was constructed by ligating portions CC of the partial cDNA clones. Nucleic acid amplification analysis of the partial cDNA clones. Nucleic acid amplification analysis CC impacted 5' and 3' of the stop codon of the DNA encoding the alpha 1B subunit revealed an alternatively spliced alpha 1B encoding mRNA in IMR32 cells. This second mRNA product is the conclude another exon that is not present in the mRNA corresp. CC to include another exon that is not present in the mRNA corresp. CC the alpha 1B subunit encoded by a DNA sequence contg. an additional context in the mRNA corresp.
